**Anti-ATRX / DIA-AX1**  
Mouse monoclonal anti-brain tumor marker  
(Astrocytoma, Oligodendroglioma), Clone AX1

### Product Information

**Reconstitution:**  
DIA-AX1, restore to 500 μl  
Reconstitute with sterile distilled water by gentle shaking for 10 minutes

**Presentation:**  
In PBS with 2% BSA, 0.05% NaN3, pH 7.4. Antibody purified from culture supernatant

**Applications:**  
Immunohistochemistry (IHC), standard formalin-fixed paraffin sections

**Dilutions:**  
1:100 - 1:200 IHC-P  
(General recommendation, validation of antibody performance/protocol is the responsibility of the end user. Positive/negative controls should be run simultaneously with patient specimen. Interpretation must be made by a qualified pathologist within the context of patient's clinical history/other diagnostic tests.)

### Reactivity

Antibody clone AX1 reacts specifically with ATRX in tissue sections from standard formalin-fixed brain tumor specimens. ATRX is a member of the Snf2 family of helicases/ATPases, which contribute to the remodeling of nucleosome structure. ATRX mutation, IDH1 mutation and chromosomal 1p/19q co-deletion are key molecular factors for the subtype diagnosis of diffuse gliomas. ATRX mutations in gliomas result in the loss of nuclear ATRX expression, which can be diagnosed by IHC analysis. Loss of ATRX expression is close to being mutually exclusive to 1p/19q co-deletion. Consequently, ATRX immunohistochemistry can be performed to replace laborious analysis of 1p/19q status by FISH techniques.

Combined immunohistochemistry of ATRX and IDH1R132H substitutes molecular testing. Astrocytoma very often harbour ATRX-mutations (>90%), whereas Oligodendroglioma typically do not (<5%). The routine practical approach for diagnosing astrocytomas and oligodendrogliomas begins with performing IHC for ATRX and IDH1 R132H expression. Stepwise analysis of molecular parameters with initial IHC for ATRX and IDH1 R132H followed by 1p/19q analysis and then by IDH sequencing significantly reduces the number of molecular tests required for unequivocal diagnosis (Reuss et al., 2015).

### Instructions for Use

**Immunohistochemical staining of standard formalin-fixed paraffin sections**

Deparaffinize and rehydrate according to standard procedures. Heat induced epitope retrieval (HIER) is required. For immunohistochemical detection different techniques can be used: Indirect immunoenzyme labeling with a secondary antibody conjugate, biotin/(strept)avidin-based detection, soluble enzyme immune complex or polymer-based detection. To detect antibody, follow the instructions provided with the particular visualization system. The antibody is suited for immuno-histochemical staining using automated platforms. Use the antibody at 1:100 - 1:200 dilution for 30min at RT.

**Intended use / regulatory status**

Europe: For in Vitro Diagnostic Use / All other countries: For Research Use only

### Storage and Stability

Store the lyophilized antibody at 2-8°C. For long time storage freeze at -20°C, thus the antibody is stable for at least one year. As reconstituted liquid store at 2-8°C short term (several weeks). For long term storage aliquot and freeze at -20°C or -80°C. Avoid repeated freeze / thaw cycles.

### Safety Notes

The material contains 0.05% sodium azide as preservative. Although the quantity of azide is very small, appropriate care should be taken when handling this material. Avoid skin and eye contact, inhalation, and ingestion.
